

## ABSTRACT

5 The method for controlling a computer that notifies an operating system of a request  
event corresponding to a device event from hardware. A device event may be  
generated, for example by a user operating a keyboard or mouse connected to the  
computer. That is, the device event occurs when a certain event is provided to the  
hardware of the computer. A request event causes a process corresponding to the  
10 device event to be performed under the control of an operating system. Then a  
response event from the operating system caused by the notification of the request  
event is accepted and a process event corresponding to the accepted response  
event is output to the hardware.
